U.S.S.N.:

10/608,757

Filing Date: June 27, 2003

EMC Docket No.: EMC-01-141CIP2

In the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the

Application.

Listing of Claims:

A software agent failure tolerant computer architecture for 1. (Previously presented)

managing resources for transfer of data stored in a data storage environment including at least

two data storage systems, the architecture comprising:

a data transfer server;

a software agent, designated as a primary software agent, in communication with at least

one of the two data storage systems and the data transfer server, the agent configured for

performing data transfer operations in response to commands from the data transfer server;

one or more failover software agents in communication with the primary software agent,

the data transfer server, and at least one of the two data storage systems, the failover software

agents being remote from the primary software agent;

a failover protocol for determining an order in which said software agents, within a

communication path of the data transfer, are designated to take over the data transfer operation in

response to one or more data transfer commands when a failure of one or more of said software

agents is determined.

2. (Original) The architecture of Claim 1, wherein the data transfer operation is a

replication of data within the data storage environment.

-3-

U.S.S.N.:

10/608,757

Filing Date: June 27, 2003

EMC Docket No.: EMC-01-141CIP2

3. (Previously presented) The architecture of Claim 1, wherein server commands to the

software agents are sent over a network in accordance with an IP protocol.

4. (Previously presented) The architecture of Claim 1, wherein the software agents

communicate with the at least one data storage system over the network in accordance with a

Fibre Channel protocol.

5. (Previously presented) The architecture of Claim 1, wherein a predetermined hierarchal

relationship is followed by the data transfer server to select the order in which the failover

software agents are commanded to take over the work of the one or more determined failed

software agents.

6. (Previously presented) A software agent failure tolerant computer architecture for

managing resources for replication of data stored in a data storage environment including at least

two data storage systems, and wherein data is replicated from one of the at least two data storage

systems to at least one other data storage system of the at least two data storage systems, the

architecture comprising:

a data replication management server;

a software agent, designated as primary software agent, in communication with at least

one of the two data storage systems and the data replication management server, the primary

software agent configured for performing data replication operations in response to commands

from the data replication management server;

-4-

U.S.S.N.:

Filing Date: June 27, 2003

EMC Docket No.: EMC-01-141CIP2

one or more failover software agents in communication with the primary software agent,

the data replication management server, and at least one of the two data storage systems, the

failover software agents being remote from the primary software agent;

a failover protocol for determining an order in which said software agents, within a

communication path of the data transfer, are designated to take over the data transfer operation in

response to one or more data transfer commands when a failure of one or more of said software

agents is determined.

7. (Previously presented) The architecture of Claim 6, wherein server commands to the

software agents are sent over a network in accordance with an IP protocol.

8. (Previously presented) The architecture of Claim 6, wherein the software agents

communicate with the at least one data storage system over the network in accordance with a

Fibre Channel protocol.

9. (Previously presented) The architecture of Claim 6, wherein the data replication

management server uses a predetermined hierarchal relationship to select the order in which

designated ones of the failover software agents are commanded to take over the work of the one

or more determined failed software agents.

10. (Previously presented) A method for managing fault-tolerant resources for replication of

data stored in a data storage environment including at least two data storage systems, and

wherein data is replicated from one of the at least two data storage systems to at least one other

Filing Date: June 27, 2003

EMC Docket No.: EMC-01-141CIP2

data storage system of the at least two data storage systems, and at least one software agent in

communication with at least one data replication management server for managing the fault

tolerant resources, the method comprising:

configuring one or more software agents as failover agents that are in remote

communication with another software agent, designated as primary software agent, which is also

in communication with the data replication management server, and at least one of the two data

storage systems;

establishing a failover protocol for determining an order in which said software agents,

within a communication path of the data transfer, are designated to take over the data transfer

operation in response to one or more data transfer commands when a failure of one or more of

said software agents is determined.

The method of Claim 10, wherein server commands to the 11. (Previously presented)

software agents are sent over a network in accordance with an IP protocol.

12. (Previously presented) The method of Claim 10, wherein the software agents

communicate with the at least one data storage system over the network in accordance with a

Fibre Channel protocol.

13. (Previously presented) The method of Claim 10, wherein the data replication

management server uses a predetermined hierarchal relationship to select the order in which

designated ones of the failover software agents is commanded to take over the work of the one or

more determined failed software agents.

Dec. 2006

U.S.S.N.:

10/608,757

Filing Date: June 27, 2003

EMC Docket No.: EMC-01-141CIP2

14. (Previously presented) A software agent failure tolerant computer system for managing

resources for replication of data stored in a data storage environment including at least two data

storage systems, and wherein data is replicated from one of the at least two data storage systems

to at least one other data storage system of the at least two data storage systems, the system

comprising:

a data replication management server;

a software agent, designated as primary software agent, in communication with at least one of

the two data storage systems and the data replication management server, the primary software

agent configured for performing data replication operations in response to commands from the

data replication management server;

one or more failover software agents in communication with the primary software agent, the data

replication management server, and at least one of the two data storage systems, the failover

software agents being remote from the primary software agent; and

a computer-executable program for carrying out a failover protocol for determining an order in

which said software agents, within a communication path of the data transfer, are designated to

take over the data transfer operation in response to one or more data transfer commands when a

failure of one or more of said software agents is determined.

15. (Previously presented) The system of Claim 14, wherein server commands to the

software agents are sent over a network in accordance with an IP protocol.

Applicant: Yao Wang, et al. 10/608,757

U.S.S.N.:

Filing Date: June 27, 2003

EMC Docket No.: EMC-01-141CIP2

16. (Previously presented) The system of Claim 14, wherein the software agents communicate with the at least one data storage system over the network in accordance with a Fibre Channel protocol.

17. (Previously presented) The system of Claim 14, wherein the data replication management server uses a predetermined hierarchal relationship to select the order in which designated ones of the failover software agents are commanded to take over the work of the one or more determined failed software agents.
